Running on an Interactive Session

If you just need a temporary space for testing some idea, I strongly suggest using the so-called UPPMAX Lab¹. It provides some pre-built environments for running temporary, ephemeral, non-persistent works, as all data will be lost when the environment is deleted, and an environment will expire after two days.

But if you somehow do require a full node to run notebook, here are the steps.

Request an interactive session

Login as usual, and start an interactive session.

```
$ interactive -A <PROJ_NAME> -p <NODE> -t <TIME>
```

Pay attention to the name of node that allocated to you, as we will use the name later. The name starts with 'p' followed by some digits.

Run Notebook in the interactive session

You can also specify a port if necessary by setting `--port=<PORT_NUM>`.

```
$ jupyter notebook --no-browser --ip=0.0.0.0
```

SSH forward

Now open another terminal, connect to UPPMAX with port forwarding option added: `-L <PORT>:<HOST>:<HOSTPORT>`.

`<PORT>` and `<HOSTPORT>` is the one you set before for Jupyter Notebook, by default 8888, and `<HOST>` is the name of node that mentioned before. For example, if your port is set to 2333 and node is p201, you should start a new connection by:

```
$ ssh -L 2333:p201:2333 <USERNAME>@pelle.uppmax.uu.se
```

Then you can click the link with the address 127.0.0.1 from Jupyter to open Notebook from your local browser.

Note

You should **NOT** terminate any connections until you finish using Notebook.

¹Currently no official name for this service
